

November 7-9, 2023 | Seoul, South Korea

Functional 2D materials are being explored for a wide range of applications, including in energy, low-power computing and biosensing. This meeting will bring together experts from diverse fields to explore the potential of functional 2D materials, ranging from layered materials to perovskites, in driving technological innovation in these different areas. Starting from the large-scale synthesis of 2D materials, the discussion will cover their applications in electronics, optoelectronics and biosensing, with a special focus on applied research and industrial translation.
